

Credit card attrition: who leaves, what it costs, and whether a campaign pays off

Revenue at risk is highest in the 3-4 months band (assumed)

Customers inactive 3-4 months leave most

Campaign ROI

ASSUMED (not real figures)

- Interchange income = 1.5% of spend. A placeholder, since the dataset has no rate. Under this assumption the campaign loses money; it would break even in the 3-4 band only if interchange were about 4.7%.
- Campaign cost = 10 per customer targeted (every customer in the band).
- Campaign success rates tested: 10%, 20%, 30%.

Source: Kaggle Credit Card Customers (BankChurners), 10,127 customers. The 0-months band has only 29 customers, so its rate is unreliable.
